Goskomstat RF (2000). Table 2.1 -- Births, deaths and the natural increase in population. In: The Demographic Yearbook of Russia, Statistical handbook. Moscow: Goskomstat.

Comments

(Births)

Prior to January 1, 1993 live births were defined as a complete expulsion or extraction of the foetus from the mother's body when the period of gestation is equal to 28 weeks or exceeds it (i.e., a foetus, 35 cm and more in length and 1000 grams and more in weight), who completed at least one original breath after the separation of the foetus from the mother's body. Live births also included fetuses born before 28 weeks of gestation (i.e., less than 35 cm in length and less than 1000 grams in weight) and having survived over 7 days (more than the end of perinatal period). According to the Instruction, adopted by the order of the Russian

Federation Ministry of Public Health No.318 and by the Goskomstat of Russia Statement No.490 of 4th December 1992, civil registrar's officers and State statistics record live births with a weight of 1000 grams or more (or when the weight is unknown with the length of 35 cm and more or with a period of gestation exceeding 28 weeks); live births with a weight less than 1000 grams (in multiple births); live births with a weight of 500 to 999 grams provided they survived more than 168 hours (7 days) after birth.
